Mahindra Comviva introduces new Smart Policy Controller version 5.0

LONDON, UK: Global provider in mobility solutions, Mahindra Comviva, introduced the latest version of their Smart Policy Controller Ver.5.0, that will help service providers to reduce the Capex/Opex for managing data traffic and significantly increase the ROI.

The new version is capable of handling over 100 million subscribers on single server and support convergent data plans - single subscriber identification, shall allow subscribers to have one data plan that can be used across multiple networks of operators such as 3G, LTE, Wi-Fi, fixed broadband and Wi-MAX, regardless of the number of devices. It is also very flexible in allowing individuals to share their data bundle with other subscribers. The solution has extensive technical and engineering advances that would significantly improve the performance of its policy function.

The Smart Policy Controller is an integral part of the overall broadband portfolio. The solution will enhance the ability of service providers to create and launch data plans independently, thereby, enabling rapid go-to-market, reduced TCO and a large bouquet of data plans for both fixed broadband and wireless networks. With this new version, consumers do not have to subscribe to multiple data plans. The Smart policy controller provides the flexibility to offer varied data plans based on subscriber preference and usage habits, resulting in rich user experience.

With over 800+ million end-users, Mahindra Comviva's end-to-end internet and broadband solutions help service providers manage, optimise and monetise their broadband infrastructure in the most efficient manner.
